

IN THE CLAIMS:

Please add new claims 16-19 as follows:

3. (Previously presented) An information apparatus for notifying output information to a remote terminal in response to an input signal of a sound, comprising:

a first memory block configured to store characteristic data representing characteristics of various sounds;

a second memory block configured to store various items of output information in correspondence to the characteristic data of the various sounds such that each one of the items of the output information is associated to each sound;

B3 a plurality of input devices that are spatially distributed to collect the sound from a source location, and that respectively provide input signals of the same sound;

a detector device that processes the input signals provided from the spatially distributed input devices to detect the source location of the sound;

an analyzer device that extracts characteristic data from at least one of the input signals of the collected sound;

a controller device that operates according to the extracted characteristic data for addressing the first memory block and the second memory block to identify one of the items of the output information corresponding to the collected sound; and

a transmitter device that transmits the identified one of the items of the output information to the remote terminal together with the detected source location of the sound.

4. (Previously presented) The information apparatus as claimed in claim 3, further comprising a canceler device configured to check whether the output information associated to the sound is true or false according to the source location of the sound, and to cancel transmission of the output information if the output information is false.

5. (Previously presented) The information apparatus as claimed in claim 3, wherein the analyzer device is configured to analyze a frequency spectrum of the sound to extract therefrom a characteristic pattern, which is stored as the characteristic data in the first memory block, and the controller device is configured to use the characteristic pattern as an index to identify the one of the items of the output information corresponding to the sound.

63 7. (Previously presented) A remote terminal for use in combination with the information apparatus as claimed in claim 3, comprising:

a receiver device configured to receive the output information transmitted from the information apparatus;

a stimulator device, said stimulator device being activated when the output information is received by the receiver device for physically stimulating a user of the remote terminal to draw attention of the user to the output information; and

a display device that is configured to display the received output information such that the stimulated user can readily read the output information.

9. (Previously presented) A method of notifying output information to a remote terminal in response to an input signal of a sound, comprising the steps of:

storing characteristic data representing characteristics of various sounds in a first memory;

storing various items of output information in correspondence to the characteristic data of the various sounds in a second memory such that each one of the items of the output information is associated to each sound;

arranging a plurality of input devices in different locations, said input devices being configured to collect the sound from a source location such that each one of the input devices provides input signals of the same sound emitted from the source location;

processing the input signals provided from the plurality of input devices to detect the source location of the sound;

extracting characteristic data from at least one of the input signals of the collected sound;

addressing the first memory and the second memory based on the extracted characteristic data so as to identify one of the items of the output information corresponding to the collected sound; and

transmitting the identified one of the items of the output information to the remote terminal together with the detected source location of the sound.

11. (Previously presented) A machine-readable medium for use in an information apparatus having a central processing unit, a plurality of input devices, a first memory storing characteristic data representing characteristics of various sounds, and a second memory storing various items

of output information in correspondence to the characteristic data of the various sounds such that each one of the items of the output information is associated to each sound, the medium containing program instructions executable by the central processing unit for causing the information apparatus to perform a process of notifying output information to a remote terminal in response to an input signal of a sound, wherein the process comprises the steps of:

operating the plurality of input devices arranged in different locations to collect the sound from a source location such that each one of the input devices provides input signals of the same sound emitted from the source location;

treating the input signals provided from the plurality of input devices to detect the source location of the sound;

extracting characteristic data from at least one of the input signals of the collected sound;

addressing the first memory and the second memory based on the extracted characteristic data so as to identify one of the items of the output information corresponding to the collected sound; and

transmitting the identified one of the items of the output information to the remote terminal together with the detected source location of the sound.

13. (Previously presented) An information apparatus for dispatching an output phrase to a remote terminal in response to an input signal of a sound, comprising:

first memory means configured to store characteristic data representing characteristics of various sounds;

second memory means configured to store various output phrases in correspondence to the characteristic data of the various sounds such that each output phrase is associated to each sound;

a plurality of input means arranged in different locations to collect the sound from a source location such that each one of the plurality of input means is configured to provide an input signal of the same sound emitted from the source location;

means for processing the input signals provided from the plurality of input means to detect the source location of the sound;

b3 means for extracting characteristic data from at least one of the input signals of the collected sound;

means for addressing the first memory means and the second memory means based on the extracted characteristic data so as to identify the output phrase corresponding to the collected sound; and

means for transmitting the identified output phrase to the remote terminal together with the detected source location of the sound.

14. (Previously presented) An information apparatus for notifying output information to a remote terminal in response to an input signal of a sound, comprising:

means for storing characteristic data representing characteristics of various sounds as well as various items of output information corresponding to said characteristic data of said various sounds such that each one of the items of the output information is associated to each sound;

means for collecting the sound to provide the input signal of the collected sound;

means for identifying one of the items of the output information corresponding to the collected sound; and

means for transmitting the identified one of the items of the output information to the remote terminal,

wherein said information apparatus includes a recognition mode of operation and a registration mode of operation, and said remote terminal includes a means for allowing a user to remotely select and set said mode of operation of said information apparatus.

15. (Previously presented) The information apparatus of claim 14, wherein the remote terminal is configured to display the output information in a format selected from the group consisting of text, graphics, images, motion picture, and combinations thereof.

16. (New) The information apparatus of claim 3, wherein the remote terminal is configured to display the output information in a format selected from the group consisting of text, graphics, images, motion picture, and combinations thereof.

17. (New) The method of claim 9, further including displaying the output information at said remote terminal in a format selected from the group consisting of text, graphics, images, motion picture, and combinations thereof.

18. (New) The machine-readable medium according to claim 11, wherein the process of notifying output information to a remote terminal further includes displaying the output information at said remote terminal in a format selected from the group consisting of text, graphics, images, motion picture, and combinations thereof.

- b3
19. (New) The information apparatus of claim 13, wherein the remote terminal is configured to display the output information in a format selected from the group consisting of text, graphics, images, motion picture, and combinations thereof.
